Ecorrection

Note:

- During the attendance check a sticker containing a unique code will be put on this exam.
- This code contains a unique number that associates this exam with your registration number.
- This number is printed both next to the code and to the signature field in the attendance check list.

## Lambda Calculus

| Exam: | IN2358 / Retake | Date: | Friday $5^{\text {th }}$ April, 2024 |
| :--- | :--- | :--- | :--- |
| Examiner: | Prof. Tobias Nipkow | Time: | $17: 00-18: 30$ |

## Working instructions

- This exam consists of $\mathbf{1 2}$ pages with a total of $\mathbf{5}$ problems.

Please make sure now that you received a complete copy of the exam.

- The total amount of achievable credits in this exam is 30 credits.
- Detaching pages from the exam is prohibited.
- Allowed resources:
- one DIN A4 sheet with hand-written notes on both sides
- one analog dictionary English $\leftrightarrow$ native language
- Subproblems marked by * can be solved without results of previous subproblems.
- Answers are only accepted if the solution approach is documented. Give a reason for each answer unless explicitly stated otherwise in the respective subproblem.
- Do not write with red or green colors nor use pencils.
- Physically turn off all electronic devices, put them into your bag and close the bag.
$\qquad$ to $\qquad$ / Early submission at $\qquad$

## Problem 1 Programming with $\lambda$-terms (12 credits)

Recall the fold encoding from the exercise sheets where a list $[x, y, z]$ is represented as $\lambda c n$. c $x(c y(c z n))$. Accordingly, the empty list is defined as nil $:=\lambda c n . n$ and we can prepend an element to a list with cons $x l:=\lambda c n$. c $x(l c n)$.
a)* Define a $\lambda$-term snoc that appends one element, i.e. it should hold that

- $\operatorname{snoc} x$ nil $={ }_{\beta}$ cons $x$ nil
- $\operatorname{snoc} x($ cons $h t)={ }_{\beta} \operatorname{cons} h(\operatorname{snoc} x t)$
$\mathrm{snoc}:=\lambda x l . \lambda c n . l c(c x n)$
Virtual points: 2.
- -1 P for minor errors, -2 P otherwhise
b)* Without using a fixed point combinator, define a $\lambda$-term reverse that reverses a list, i.e. it should hold that
- reverse nil $={ }_{\beta}$ nil
- reverse $($ cons $h t)={ }_{\beta}$ snoc $h($ reverse $t)$
reverse $:=\lambda l . l$ snoc nil
Virtual points: 3.
- -2 P for minor errors, -3 P otherwhise
c)* Implement reverse again using the fixed point combinator fix. Your implementation must not rely on the underlying encoding of lists but you may use the functions nil, cons, null, head, tail with the usual semantics. Additionally, you may use snoc. Remember that null returns a boolean, i.e. null nil $x y \rightarrow_{\beta}^{*} x$ and null (cons $h t) x y \rightarrow_{\beta}^{*} y$.
reverse $:=\operatorname{fix}(\lambda r . \lambda l .($ null $l)$ nil $(\operatorname{snoc}($ head $l)(r($ tail $l))))$
Virtual points: 4.
- 1P for the structure: fix $(\lambda r . \lambda l$. (null $l) ? b(? r($ head $l)($ tail $l))$ ).
- 3P for the rest: -1P for minor errors, -2 P for missing anchor, -3 P for substantial errors

## Problem 2 Rewriting (8 credits)

Let $\rightarrow \subseteq A \times A$ be a relation. Below, all variables are implicitly assumed to be elements of $A$.
The set $S$ of direct successors of $x$ is defined as $S(x)=\{y \mid x \rightarrow y\}$.
We call $\rightarrow$
finitely branching if every $x$ has only finitely many direct successors, i.e. $S(x)$ is finite.
$\mathbb{N}$-terminating if there is a function $t: A \rightarrow \mathbb{N}$ such that

$$
x \rightarrow y \Longrightarrow t(x)>t(y)
$$

An element $x$ is called bounded, or more explicitly $k$-bounded, if the length of all reductions starting from $x$ is bounded: there is a $k \in \mathbb{N}$ such that for every $y$ it holds that $x \rightarrow^{n} y \Longrightarrow n \leq k$.

Assume that $\rightarrow$ is finitely branching and $\mathbb{N}$-terminating. Prove that all $x$ are bounded.
Hint: Proof by induction.
The proof must be given in the standard verbal style.

We assume that $\rightarrow$ is finitely branching and $\mathbb{N}$-terminating (with function $t$ ) and prove that every $x$ is bounded.

The proof is by (strong) induction on $t(x)$. We may assume that all $y$ with $t(y)<t(x)$ are bounded 2P. Let $S(x)=\left\{y_{1}, \ldots, y_{n}\right\}$ (because $\rightarrow$ is finitely branching) 1P. Because $x \rightarrow y_{i}$ we have $t\left(y_{i}\right)<t(x)$. Thus there are $k_{1}, \ldots, k_{n}$ such that $y_{i}$ is $k_{i}$-bounded 1P. Let $k=\max \left\{0, k_{1}, \ldots, k_{n}\right\}+12 \mathrm{P}$. Then $x$ is $k$ bounded: If $x \rightarrow^{n} z$ then either $n=0$ (in which case $n \leq k$ ) 1P or $x \rightarrow y_{i} \rightarrow^{n-1} z$. By IH $n-1 \leq k_{i}$ and therefore $n \leq k 1 \mathrm{P}$.
Virtual points 8 .

## Problem 3 Quiz (3 credits)

a)* We define the set of WNF inductively with

$$
\begin{gathered}
\frac{t_{1}, \ldots, t_{n} \in \mathrm{WNF}}{x t_{1} \ldots t_{n} \in \mathrm{WNF}} \\
\overline{(\lambda x . t) \in \mathrm{WNF}}
\end{gathered}
$$

Give a closed term $t$ such that $t \in$ WNF but $t \notin$ NF. Justify your choice of $t$ !

Let $t=(\lambda x .(\lambda x . x)(\lambda x . x))$. Then, $t \in$ WNF by the second rule but $t \notin$ NF since

$$
(\lambda x .(\lambda x . x)(\lambda x . x)) \rightarrow_{\beta}(\lambda x .(\lambda x . x)) .
$$

Virtual points: 3.

- 2 P for a correct term
- 1P for the justification
b)* Give a type $\tau$ such that only finitely many simply typed $\lambda$-terms $t$ have that type, i.e. it holds that $\vdash t: \tau$.

Let $\tau=A \rightarrow B$. Then, no term has type $\tau$.
Virtual points: 2.

- 2 P for a correct answer, 0P otherwhise.
c)* Let $f$ be a $\lambda$-term with type bool $\rightarrow$ bool in System F , i.e. it holds that $\vdash f:$ bool $\rightarrow$ bool. Is it decidable whether $f x \rightarrow_{\beta}^{*}$ true for every $x$ in $\beta \eta$-normal form with type bool?
Remember that there are exactly two terms with type bool that are in $\beta \eta$-normal form, namely true and false.

Yes. Since System F is strongly normalising, we can reduce $f$ true and $f$ false to normal form and check whether both are equal to true.
Virtual points: 3.

- 1 P for the idea to normalise the two terms
- 2 P for the justification why the normalisation terminates

## Problem 4 Typing with let-polymorphism (5 credits)

Consider simply typed lambda calculus extended with let and consider the following the typing problem

$$
a: A \vdash \text { let } x=\lambda z . z a \text { in } \lambda y . x(x y): ? \tau
$$

where $A$ is a type variable.
a)* Find a most general type schema $\sigma$ with $a: A \vdash \lambda z . z a: \sigma$. You may, but you do not need to draw a type derivation tree.

$$
\sigma=\forall C .(A \rightarrow C) \rightarrow C
$$

Virtual points: 2.

- -1P for minor errors (e.g. missing parentheses), -2 P otherwhise
b) Draw the type derivation tree for

$$
a: A, x: \sigma \vdash \lambda y \cdot x(x y): ? \tau
$$

Of course, with the correct type for ? $\tau$.
Use only the introduction and elimination rules for $\rightarrow$ and $\forall$ and the standard assumption rule

$$
\Gamma \vdash x: \tau \quad \text { where } \quad \Gamma(x)=\tau
$$

Let $\Gamma:=a: A, x: \sigma, y: B$. The solution is $? \tau=(A \rightarrow A \rightarrow D) \rightarrow D$.

Virtual points: 5.

- -1.5P (per instance) for incorrect use of $\forall \mathrm{E}$ due to errors in part a)
-     - 1 P for minor errors
- -2 P for substantial errors

## Problem 5 Intuitionistic Logic (2 credits)

In this exercise, we consider intuitionistic logic with just the rules $\wedge \mathrm{I}, \wedge \mathrm{E}_{1}, \wedge \mathrm{E}_{2}, \neg \mathrm{I}$, and $\neg \mathrm{E}$, i.e.

$$
\begin{gathered}
\frac{\Gamma, A \vdash \perp}{\Gamma \vdash \neg A} \neg \mathrm{I} \\
\frac{\Gamma \vdash \neg A \quad \Gamma \vdash A}{\Gamma \vdash \perp} \neg \mathrm{E}
\end{gathered}
$$

In the following, explicitely annotate the rule that was used for each inference step.
a)* Prove that an assumption $A$ can be weakened to $A \wedge B$ in intuitionistic logic, i.e. show that $\Gamma, A \vdash C$ implies $\Gamma, A \wedge B \vdash C$. Use induction on the derivation of $\Gamma, A \vdash C$. You only need to consider the cases where $\Gamma, A \vdash C$ was proved by assumption or $\wedge \mathrm{I}$.

- Case assumption:

We have $\Gamma, A \vdash C$ and $C \in \Gamma, A$. If $C \in \Gamma$, then we have $\Gamma, A \wedge B \vdash C$ by assumption 1P. If $C=A$, we have the following proof tree 1 P :

$$
\overline{\frac{\Gamma, A \wedge B \vdash A \wedge B}{\Gamma, A \wedge B \vdash A}} \wedge \mathrm{E}_{1}
$$

- Case $\wedge \mathrm{I}$ :

We have $\Gamma, A \vdash C \wedge D$. As induction hypotheses we obtain that $\Gamma, A \wedge B \vdash C$ and $\Gamma, A \wedge B \vdash D$ 1 P . We justify our goal with the following proof tree 1P:

$$
\frac{\overline{\Gamma, A \wedge B \vdash C} \text { I.H. } \quad \overline{\Gamma, A \wedge B \vdash D}}{\Gamma, A \wedge B \vdash C \wedge D} \wedge \mathrm{I} .
$$

Virtual points: 4.
b)* In order to represent implication, we view $A \rightarrow B$ as an abbreviation for $\neg(A \wedge \neg B)$. Prove the implication introduction rule, i.e. show that $\Gamma, A \vdash B$ implies $\Gamma \vdash A \rightarrow B$.

$$
\wedge \mathrm{E}_{2} \frac{\overline{\Gamma, A \wedge \neg B \vdash A \wedge \neg B}}{\frac{\Gamma, A \wedge \neg B \vdash \neg B}{\Gamma,} \frac{\overline{\Gamma, A \vdash B} \text { Assumption }}{\Gamma, A \wedge \neg B \vdash B} \text { Part a) }} \underset{\frac{\Gamma, A \wedge \neg B \vdash \perp}{\Gamma \vdash \neg(A \wedge \neg B)} \neg \mathrm{I}}{\mathrm{E}}
$$

Virtual points: 4.

- -2 P for minor errors
- -3P for substantial errors

Additional space for solutions-clearly mark the (sub)problem your answers are related to and strike out invalid solutions.
